

FINLYTICS

How Finlytics Works?

1. What Finlytics Is, In One Sentence :

Finlytics is a personal finance app that lives in your web browser, it tracks your accounts, spending, budgets, and goals, shows you charts, and lets you ask it questions in plain English (or Urdu) like you'd ask an accountant.

Think of Finlytics as three things working together:

- A notebook, where all your money data actually lives.
- Seven rooms, Dashboard, Transactions, Wallet, Analytics, Reports, Assistant, Settings each one just a different way of looking at what's in the notebook.
- A helpful assistant, who can read the notebook, answer questions about it, and write new entries into it when you ask.

That's really it. Everything else in this document is just “how those three things are built,” in more detail.

2. The Notebook (Where Your Data Lives) :

Every page you open Dashboard, Wallet, Analytics, everything reads from and writes to the exact same notebook. There's only one. This matters because it means:

If you add a transaction on the Transactions page, the Dashboard's charts update too they're reading the same notebook, not separate copies.

If you ask the Assistant “add a 500 rupees' grocery expense” it writes into the exact same notebook the Wallet page reads from so it can't accidentally create data, the rest of the app doesn't know about.

❖ Where the notebook physically is

By default, the notebook is stored right there in your web browser (a technology called “localStorage”). This means:

- It works immediately, with zero setup, even with no internet connection.
- It stays on that one browser open the app on your phone and it won't see the data you entered on your laptop.

If you want your data to follow you across devices, you can (optionally) connect a free online database called Supabase. Think of this as photocopying your notebook and mailing a copy to a filing cabinet in the cloud, so any device can pull the latest copy. This step is entirely optional the app works fully without it.

3. What's actually written in the notebook :

Six kinds of entries, in plain terms:

What it's called	What it really is
Accounts	Your wallet, bank account, credit card, savings each with a balance
Transactions	Every time money came in or went out
Budgets	A monthly spending ceiling per category, so you get warned before overspending
Goals	Something you're saving toward, with a target amount and a deadline
Recurring bills	Things that repeat rent, subscriptions, salary, so you don't have to re-enter them every month
Saved reports	Questions you asked the Assistant that you bookmarked to check again later

4. The Seven Rooms (Pages) :

Pages you see

All seven pages share one data source, so nothing gets out of sync between pages.

Each page is just a different lens on the same notebook:

Dashboard :	the “at a glance” view: how much you made spent and saved recently
Transactions:	the full list of every entry with the ability to add one by hand or upload a bank statement file and have it read in automatically.
Wallet :	your accounts budgets goals and recurring bills each with its own tab
Analytics:	deeper charts: spending by category trends over time cash flow
Reports :	a printable/exportable summary like a bank statement you could hand to someone else.
Assistant :	a chat window where you type or speak a question and get an answer a chart or both
Settings :	your name light/dark mode and (for the technically-minded) where the optional cloud database and AI connection details go

All seven share the same sidebar/menu and the same light/dark color scheme, so it feels like one app, not seven separate ones.

5. The Assistant (How It “Thinks”)

The assistant answers questions in a very sensible order: try the fast, free, obvious answer first, and only reach for something slower and smarter if it truly has to. Picture asking a question to office staff set up like this:

1) The receptionist (instant, free)

A quick-thinking receptionist recognizes common questions immediately “add an expense” , “show my spending by category” , “how much is left in my grocery budget” and answers right away, using a big list of question patterns they've memorized. This handles most everyday questions instantly, with no internet call and no cost.

This receptionist is also forgiving of typos and rough phrasing “bugett” still gets understood as “budget” .

2) The smart consultant (only when needed)

If the receptionist genuinely doesn't recognize the question it's phrased in an unusual or very open-ended way the question gets forwarded to a smarter, general-purpose assistant (a hosted AI language model). This consultant is handed a short summary of your recent numbers (not your whole notebook, just a summary) so it can give a sensible, personalized answer. This step only happens if you've provided a key for one of these AI services, and it's given a strict 3-second deadline if it takes too long or fails, the app doesn't just sit there loading, it moves to the next step.

3) The polite fallback

If neither of the above worked (no AI service configured, or it failed), you still get a friendly, useful reply explaining what kinds of questions the assistant can help with never a dead end or an error message.

A note on “training”

People sometimes assume an AI assistant like this is “trained on your data.” It isn't. The receptionist (Step 1) is just a very long, hand-written list of question patterns nobody “trains” it, you just add more patterns to the list over time. The consultant (Step 2) is a general-purpose AI model that already

knows how to talk it's simply handed a short written summary of your numbers each time you ask, the same way you might hand a substitute teacher a one-page briefing before class. Nothing is permanently "learned" from your data.

6. Keeping Things Safe

Passwords and connection keys (for the optional cloud database and the optional AI service) live in exactly one place: a single settings file on disk. Nobody can type a new key into the app and have it saved from the screen on purpose. This avoids a whole category of accidental leaks (like a key ending up somewhere it shouldn't, e.g. in a screenshot or a browser's saved-forms list).

The Settings page can show you what's currently configured (in a masked, password-style box) so you can double check it's set up but changing it always means opening that one file directly. The assistant can only change your data through the same safe "add/edit/delete" actions the rest of the app uses it can never run some arbitrary, unchecked command against your notebook.

7. The Bigger Vision (Not Built Yet)

The original idea behind this project was bigger than one person's personal notebook it imagined a version for businesses, where many different companies (each with their own, messy, differently-organized records) could all ask questions in plain English and get answers pulled straight from their real database, with no company needing custom setup.

In everyday terms, that bigger version would work like this:

Every night, a translator goes through each company's records and rewrites them into one standard, tidy format regardless of how messy or unique the original records were.
